

VAYA RUJCA GAME: *User guide*

Vaya Rujca Game is a 1v1 computer videogame developped for Linux. In **VRG** you will be able to put your face and your partner's face into the game and play a friendly beer pong match. Move your robot, aim for the glasses and score!

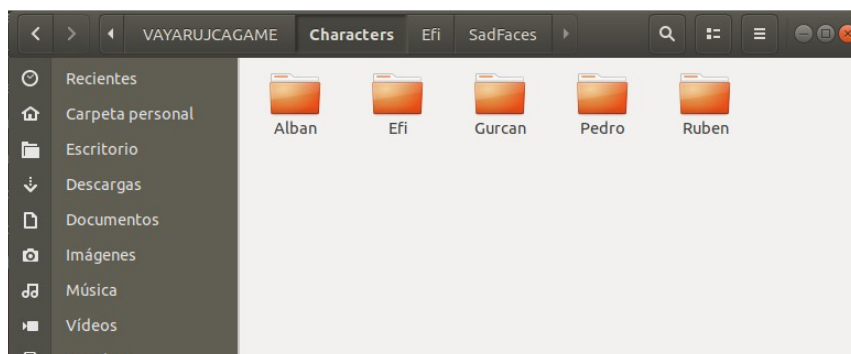

To **run** the game just open your terminal in the game directory and run the **vrg** executable, passing as parameters the names of the characters you would like to select (only 2). Write them carefully, exactly like their names in their character directory! Once the game is running, a screen with 2 robots in front of a table will appear. Player 2 will start throwing.

In order to throw the ball, keep the **barspace** pressed to store force and release it to throw. To aim for the glass, move the robot left and right with the **left and right arrow keys**, and lift or lower the robot arm with the **up and down arrow keys**. Leaving the game is as simple as pressing **Alt+F4**.

If you want to create a new character you only need to entre in the 'Characters' directory inside the game folder. Create a new directory with the name of the new character and enter this new directory. Now create 2 new directories: 'HappyFaces' and 'SadFaces'. Again, write them properly or the game will not be able to detect them. Put any photos you want inside this directory and they will be displayed within the game.

Example:

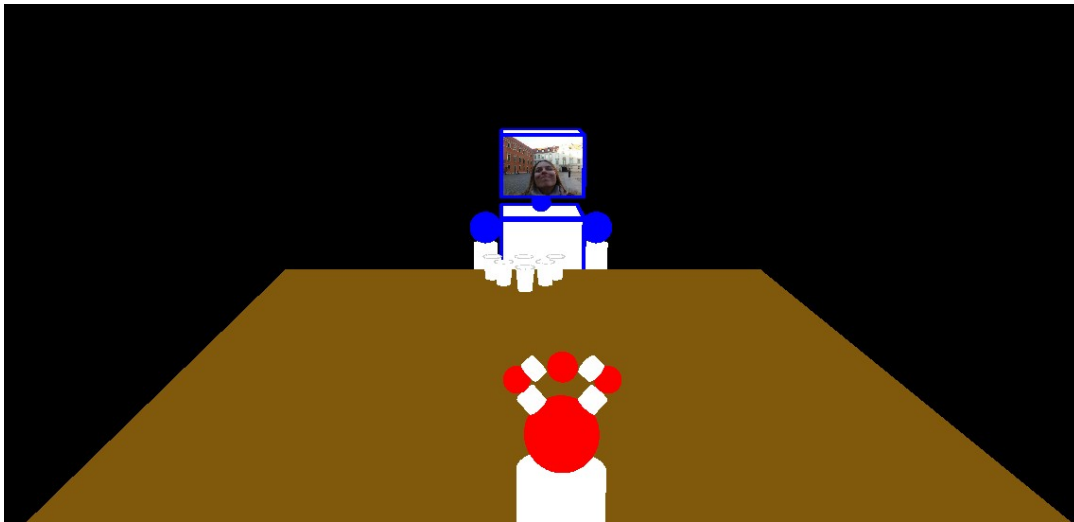

1. Your 'Characters' directory should look similar to this.

2. Run the game on your terminal using a command like the next one:

```
Archivo  Editar  Ver  Buscar  Terminal  Ayuda
alejandro@alejandro-Aspire-E5-573G:~/MEGA/VAYARUJCAGAME$ ./vrg Efi Pedro
```

3. When the game opens and you are in control of your robot just play!

Your goal will be to make your opponent drink all their glasses and win the match. It's Beerpong time!
